

# INSTALLATION QUICK GUIDE KITCHEN ICE

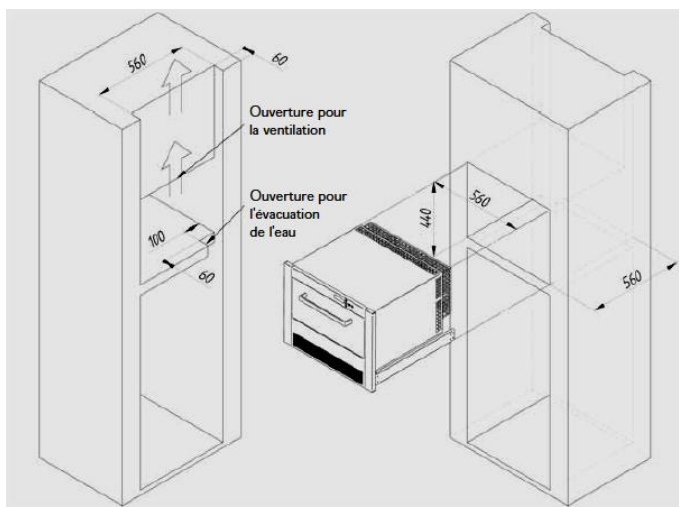

## IMPORTANT NOTE ABOUT INSTALLATION:

The water drain must be in the position indicated in the diagram:

On the left-hand side of the housing and **below the level of the bottom of the equipment** because the equipment has **gravity drainage** rather than an evacuation pump.

In this way, **the two** flexible drain pipes will have enough space to allow the removal of the equipment if necessary.

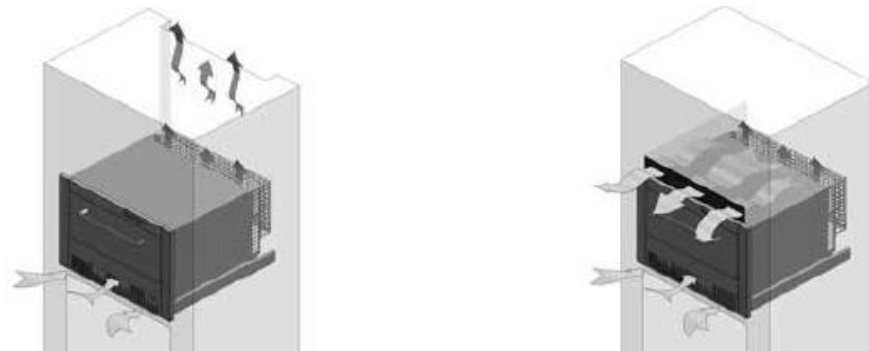

[Ventilation opening/ Water drainage opening]

**!!! THE TWO drain pipes must be connected to the drain!!!**

## IMPORTANT

It is essential to remember to leave an outlet for the air that passes through the front flange: this can be a hole at the back (with external outlet) or a ventilation flange above the equipment. (See diagram).

## INSTALLATION RULES

For further information, please refer to the installation leaflet provided.
